

Abciximab

Revised: November 15, 2023.

CASRN: 143653-53-6

Drug Levels and Effects

Summary of Use during Lactation

No information is available on the clinical use of abciximab during breastfeeding. Because abciximab is a large protein molecule with a molecular weight of 47,615 Da, the amount in milk is likely to be very low.[1] It is also likely to be partially destroyed in the infant's gastrointestinal tract and absorption by the infant is probably minimal.[2] Until more data become available, abciximab should be used with caution during breastfeeding, especially while nursing a newborn or preterm infant. Waiting for at least 2 weeks postpartum to resume therapy may minimize transfer to the infant.[3] If it is used by a nursing mother, monitor the infant for bruising and bleeding.

Drug Levels

Maternal Levels. Relevant published information was not found as of the revision date.

Infant Levels. Relevant published information was not found as of the revision date.

Effects in Breastfed Infants

Relevant published information was not found as of the revision date.

Effects on Lactation and Breastmilk

Relevant published information was not found as of the revision date.
