

Voxelotor

Revised: May 11, 2020.

CASRN: 1446321-46-5

Drug Levels and Effects

Summary of Use during Lactation

Voxelotor is an orally administered drug that binds to hemoglobin S, inhibiting polymerization. No information is available on the appearance of voxelotor in milk or on the safety of the drug in breastfed infants, but its low molecular weight of 337 Da indicates that it probably passes into milk. Because of the potential for serious adverse reactions in the infant, breastfeeding is currently not recommended during treatment and for at least 2 weeks after the last dose.
