<p>Full citation</p> <p>Alcantara, M., Serra-Aracil, X., Falco, J., Mora, L., Bombardo, J., Navarro, S., Prospective, controlled, randomized study of intraoperative colonic lavage versus stent placement in obstructive left-sided colonic cancer, World Journal of Surgery, 35, 1904-1910, 2011</p> <p>Ref Id</p> <p>833326</p> <p>Country/ies where the study was carried out</p> <p>Spain</p> <p>Study type</p>	<p>Sample size</p> <p>n= 28 n stent as bridge to surgery (SBTS)= 15 n emergency surgery (ES)= 13</p> <p>Characteristics</p> <p>SBTS, n= 15 Age, years, mean (SD)= 71.9 (8.96) Male, sex, n=5 Duration of obstruction, days, median (IQR)=4 (4) Site of tumour, n Splenic flexure=2 Descending colon=1 Sigmoid colon=11 Rectosigmoid junction=0 Rectum 1/3 sup=1 ASA, n I-II=5 III=8 IV=2</p>	<p>Interventions</p> <p>Stent as a bridge to surgery: "In case of complications during stent placement (i.e., perforation or technically impossible to place), emergency surgery was performed. The success of the procedure was defined as the clinical appearance of intestinal transit and the disappearance of the obstruction on abdominal radiography. In the case of stent migration, attempts were made to reinsert it. If successful, this was recorded as a complication but the intervention was still considered as scheduled, as indicated in the protocol. In the case of hemorrhage, conservative treatment was used. The surgery was scheduled for 5-7 days after stent placement."</p>	<p>Details</p> <p>Randomisation: Via sealed envelope Blinding: Not possible Outcomes: Complications due to the placement of the stent, surgical time, total and postoperative hospital stay, pathology study of the resection, surgical site infection (superficial, deep, and organ-space), anastomotic dehiscence, postoperative complications (seroma, ileus, evisceration), postoperative reintervention and disease free survival (oncologic relapse) Follow-up: Subsequent controls were performed at surgery outpatient units after 6, 12, 18, 24, 48, and 60 months. Data analysis: "The quantitative variables were described using means and standard deviation when the distribution was considered normal; otherwise, the values of the median, interquartile interval, and range were used. The intention-to-treat analysis included all randomized patients. The per-protocol analysis included all patients receiving stent and scheduled surgery in the stent group and all patients in the emergency surgery group. The statistical analysis of the quantitative variables, with independent groups, was performed with the Student t-test, parametric test, or the nonparametric Mann-Whitney U test. In the statistical analysis of the categorical variables,</p>	<p>Results</p> <p>Disease-free survival, event is relapse SBTS= 8/15 ES= 2/13 Kaplan-Meier log-rank test= 0.055 Hospital mortality, n/N SBTS=0/15 ES=1/13 Hospital days, median (IQR) SBTS= 13 (3) ES= 10 (10) p-value= 0.105 Anastomotic leak, n/N SBTS=0/15 ES=4/13 Global-Surgical Site Infection, n/N SBTS=2/15 ES=6/13 Technical success, n SBTS= 15/15</p>	<p>Limitations</p> <p>Cochrane risk of bias tool Selection bias Random sequence generation: unclear risk (sequence generation not reported) Allocation concealment: unclear risk (not reported) Performance bias Blinding of participants and personnel: low risk (not possible, but unlikely to affect performance on objective outcomes) Detection bias Blinding of outcome assessment: low risk (not possible, but unlikely to affect assessment of objective outcomes) Attrition bias Incomplete outcome data: low risk (intention to treat analysis and per protocol analysis used) Reporting bias Selective reporting: low risk (primary outcome points were reported) Other bias High risk of bias: Due to the high rate of anastomotic leak in the emergency surgery group, the study was terminated early (n</p>

Data for these patients were analyzed in the stent group according to intention-to-treat principles." Surgery= "had surgery to decompress their obstruction by a technique determined appropriate by the operating surgeon and the pathology encountered. Although it was expected that the vast majority of patients undergoing surgery would require a stoma, a stoma was not enforced as the only option. This was to ensure that the control group reflected what the surgery would truly be, whether with stoma, resection, or anastomosis, when stent</p>	<p>Details</p> <p>Randomisation: computer-generated permuted block randomization schedule, completed by the study coordinator Allocation: "It was not possible to blind surgeons and patients to the procedure; however, all subjective outcome assessments were performed by a blinded investigator." Outcomes: Primary outcome: Quality of life (differences between groups in EQ-5D index change scores). Secondary outcomes: overall survival (survival at 12 months postprocedure), 30-day mortality (death from any cause up to 30 days after the procedure), rates of permanent stoma formation, procedure time, anesthetic time, postprocedure stay, days spent in the intensive care unit and high dependency unit, time to first flatus and first bowel movement, time to start of a normal diet, early postprocedure complication rate, 12-month complication rate, length of stay, disease-related readmission, and differences in QLQ CR-29 scales. Follow up: 12-months Statistical analysis: All data were analyzed on an intention-to-treat basis. The level of significance for all tests was $p < 0.05$. Continuous data were analyzed by using an independent T test or nonparametric tests where appropriate. EQ-5D index change scores and QLQ CR29 data were compared between treatment groups. Categorical data were analyzed using the χ^2 and Fisher exact tests (FET). Mean and medians are reported alongside the SD, interquartile range, or 95% CIs, where appropriate. Kaplan-Meier analysis was used to describe time-to-event data. Overall survival was measured from the date of surgery or stent procedure to the</p>	<p>Results</p> <p>1-year overall survival, event is death from any cause Stent= 17/26 Surgery= 19/26 Log-rank test= 0.61 Technical success in stent group= 19/26 Clinical success in successfully stented group= 19/19 30-day mortality, n Stent= 2/26 Surgery= 4/26 Postprocedure stay, days, median (95% CI)* Stent= 7 (3-12) Surgery= 11 (8-17) p-value= 0.03 *Assessed as the number of days spent in the hospital for the procedure Anastomotic leak, n Stent= 0/26 Surgery= 0/26 Wound infection, n Stent= 0/26 Surgery= 1/26 Stoma, n Stent= 7/26 Surgery= 24/26 Quality of life, mean EQ-5D change score from baseline to 1 year Stent= -0.328 Surgery= -0.561</p>	<p>Limitations</p> <p>Cochrane risk of bias tool Selection bias Random sequence generation: low risk Allocation concealment: unclear risk (not reported) Performance bias Blinding of participants and personnel: unclear risk (method for double blinding not reported, lack of blinding could potentially affect patients' performance on subjective outcomes i.e. Quality of Life; unlikely to affect objective outcomes) Detection bias Blinding of outcome assessment: low risk (not possible to blind, but subjective outcomes assessed by blinded investigator; lack of blinding unlikely to affect assessment of objective outcomes) Attrition bias Incomplete outcome data: low risk (intention to treat analysis used) Reporting bias Selective reporting: low risk (primary outcome points were reported) Other bias</p> <p>Other information</p>
